Research Pulse · Component map (as designed)

Steps 02 to 12 run unattended every Monday. Step 01 can happen any time and applies from the next run. Solid arrows are the main flow, dashed is optional.

Gemini Flash is the only AI in the system and is called in four places: the settings helper (01, shown in blue because she makes the final edit), per-domain judging (08), the headline (10) and the in-app assistant (19). Every other step is plain code, so a Gemini outage degrades the brief (ranked list, no summaries) instead of stopping it. The system never claims a paper is validated.

Not pictured (shipped after this map was drawn): Stage 5 upgrades — claim-check / deep read on the top pick per domain, OpenReview + OpenAlex context for the judge, and a GitHub Actions cron backstop — plus the client-export digest at /export, which turns "Save for client" picks into a downloadable/copyable brief.
